Comprehension:

Read the following passage and answer the questions that follows.

Volcanoes are the natural phenomena posing danger to the human population and other living organisms nearby. Volcanoes are those ruptures on the earth's surface or crust that allow gases and hot and molten rock to escape from deep below the surface. There are three main types of volcanoes in the world. They are super volcanoes, volcanic cones and submarine volcanoes. Super volcanoes produce the largest eruptions on the earth. These eruptions produce the most volume, causing severe impact and even altering the global climate for years. They also alter the landscape of the surrounding area. Super volcanoes are classified as massive eruptions and large igneous province. Large igneous provinces are the extensive regions of basalt on a continental scale. These are caused as a result of flood basalt eruptions.

Volcanic cones are the simplest types of volcanoes. When small pieces of pyroclastic rocks and scoria, the vesicular ejections of basaltic and andesitic magmas, are thrown out and built at the vent of a volcano, they are called cinder volcanoes. These eruptions can be short-lived as compared to the other volcanoes. They produce cone-shaped hills that are about thirty to forty hundred meters high. Cinder cones erupt only once. The different types of volcanic cones are Ash cone, Spatter cone and Cinder cones.

Ash cones have a composition of silt and sized particles. The interaction among the volcanic gases, magma and expanding steam ejects very small particles called ash.

SubQuestion No : 38

Q.38 Select the option that is nearest in meaning to the word given below.

Basalt

Ans  1. A dark grey-coloured volcano rock

 2. A dark brownish volcano rock

 3. A reddish basic volcano rock

 4. A white coloured basic volcano rock

Comprehension:

Read the given passage carefully and answer the questions that follow.

Wildlife plays a crucial role in maintaining ecological balance; yet human activities have led to the rapid decline of many species. Deforestation, habitat destruction and poaching threaten biodiversity, pushing several animals to the brink of extinction. Additionally, climate change exacerbates these threats by altering natural habitats and making survival more difficult for many species.

Conservation efforts have gained momentum, with governments and organisations implementing laws to protect endangered species. National parks, wildlife sanctuaries and breeding programmes aim to restore populations and preserve habitats. However, illegal wildlife trade and climate change continue to pose significant threats. Despite legal protections, poaching remains rampant, driven by the high demand for animal products. Without stricter enforcement and global cooperation, many species may face extinction in the coming decades.

Sustaining biodiversity requires collective effort. Educating communities, enforcing conservation laws and promoting responsible tourism can help protect the world's wildlife for future generations. By taking immediate action, humans can help preserve the delicate balance of nature and ensure that future generations inherit a planet rich in biodiversity.

SubQuestion No : 8

Q.8 What is the most suitable title for the passage?

- Ans**  1. The Expansion of Agriculture
-  2. The Importance of Wildlife Conservation
-  3. The Benefits of Deforestation
-  4. The Rise of Urbanisation
